

# **Forecasting Tax Revenues in Latvia: Analysis and Models**

Velga Ozolina, Astra Auzina-Emsina,  
Remigijs Pocs

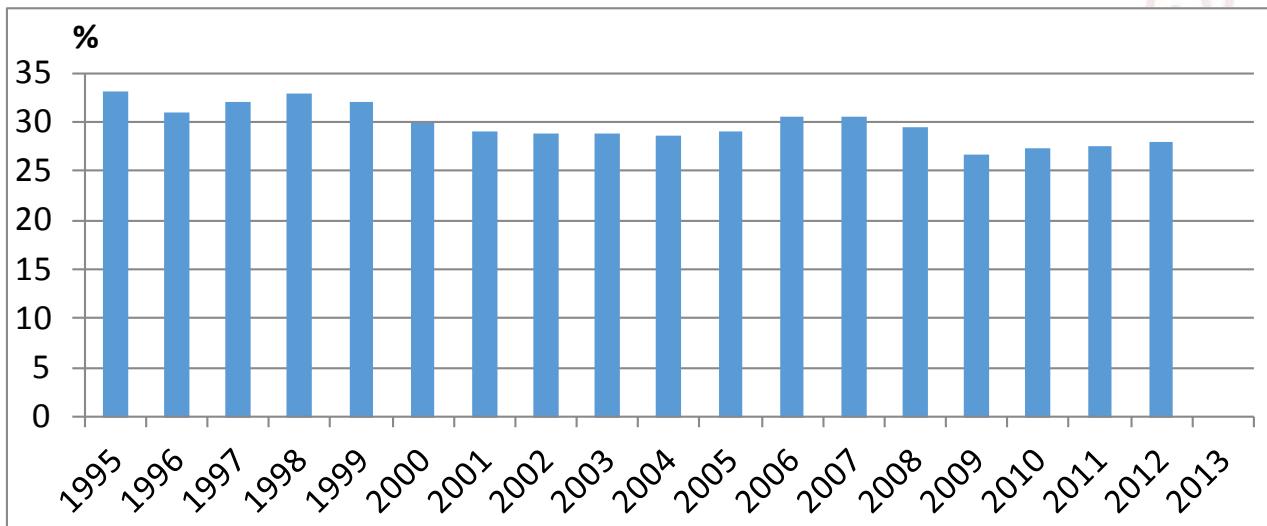

Riga Technical University, Latvia

# Data Analysis

- CSB data
- Ministry of Finance data
- State Revenue Service (SRS) data
- Eurostat data

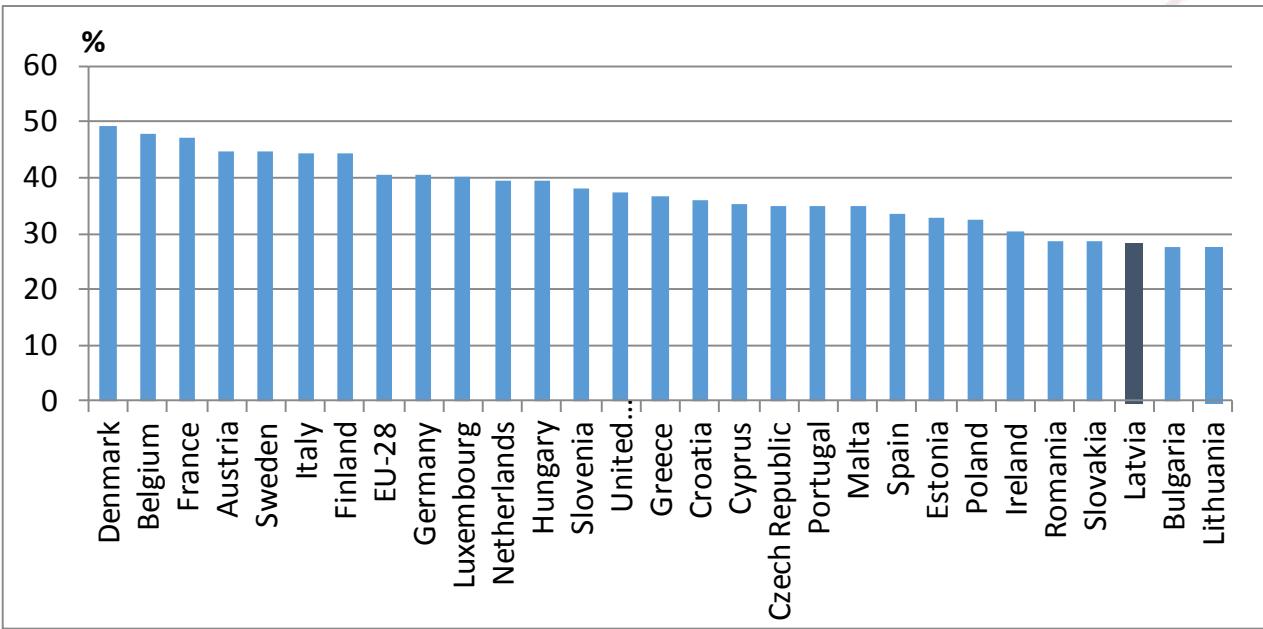

# Tax Burden in Latvia in 1995-2012, % of GDP

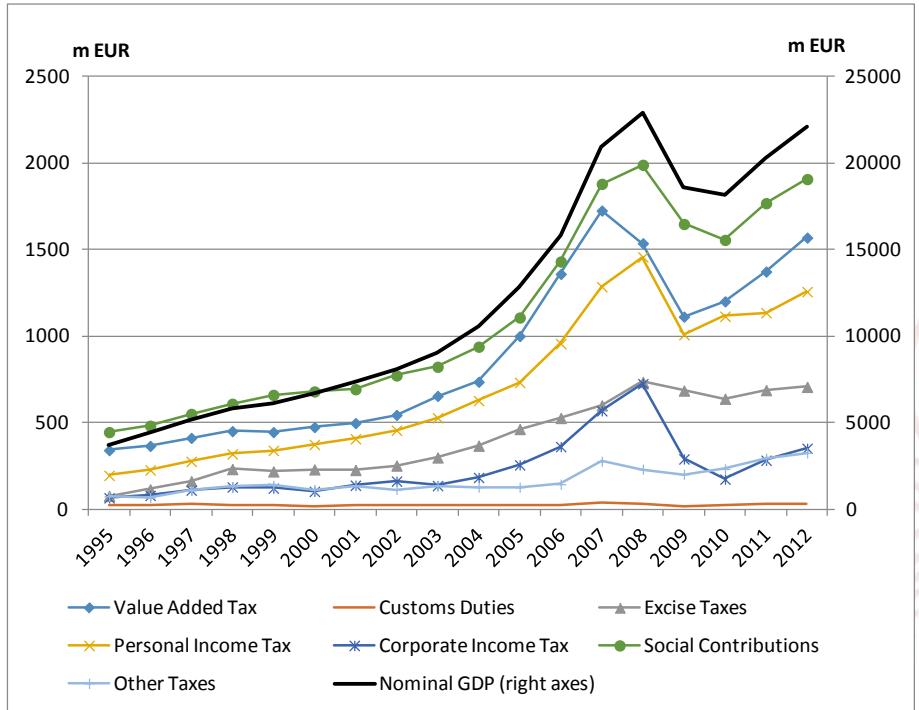

Data Source: CSB database

# Tax Burden in the EU Countries in 2012, % of GDP

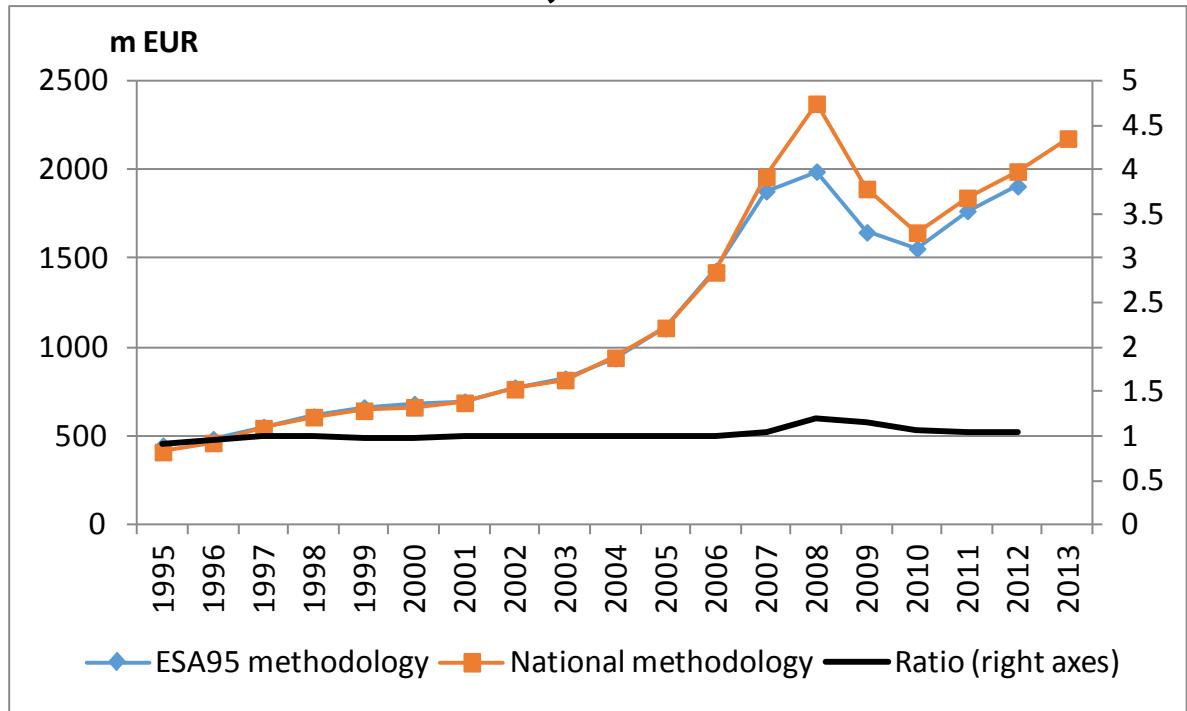

Data Source: Eurostat database

# Tax Revenues in Latvia (ESA95 methodology), m EUR

Data Source: CSB database

# Social Contributions in Latvia, m EUR

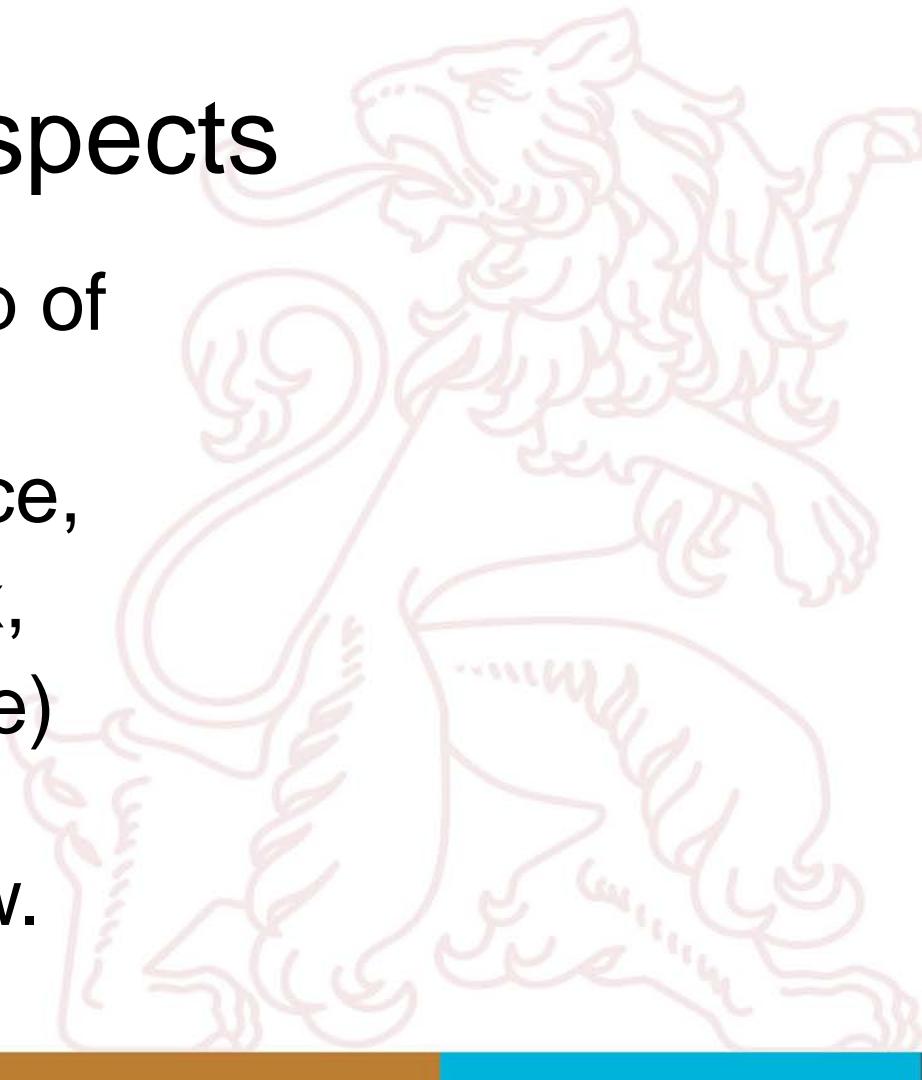

Data Source: CSB database, Ministry of Finance data

# Analysis of Legal Aspects

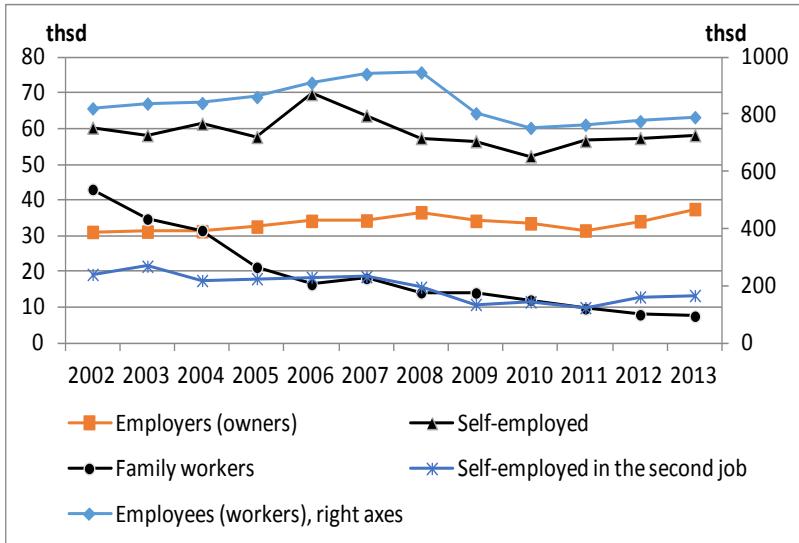

The main laws in the group of direct taxes are:

- On State Social Insurance,
- On Personal Income Tax,
- On Corporate (Enterprise) Income Tax,
- Micro-enterprise Tax Law.

# Analysis of Legal Aspects

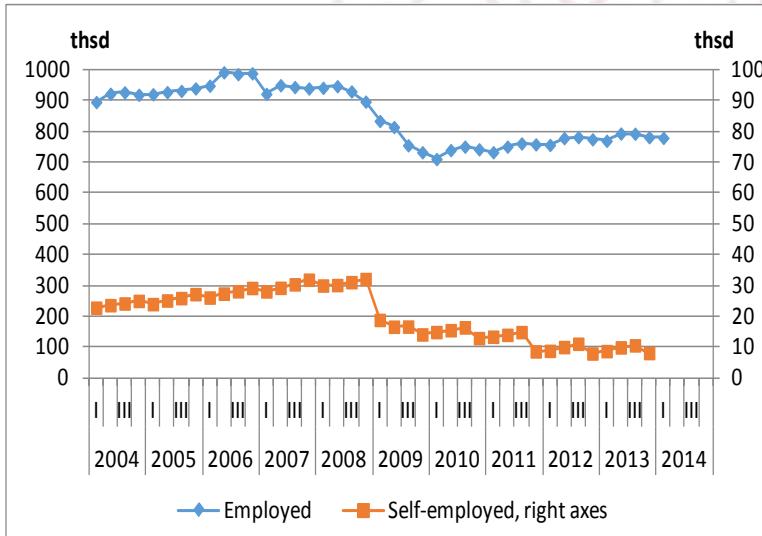

- Employed persons by professional status, thsd

Overall statistics (CSB)

Taxpayers (SRS)

Data Source: CSB database, State Revenue Service data

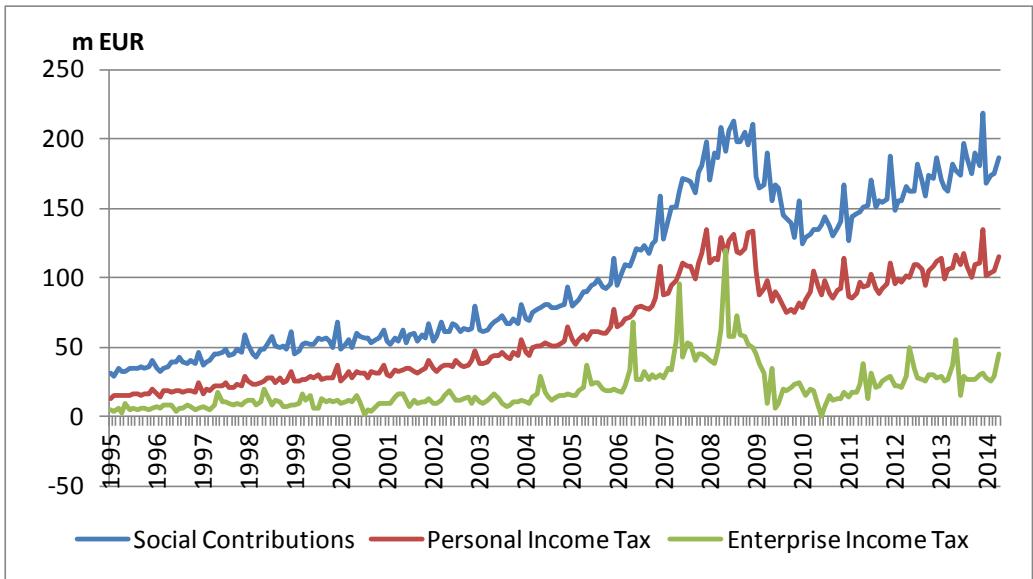

# Analysis of Legal Aspects

The main laws in the group of indirect taxes are:

- Value Added Tax Law (before 2013 law On Value Added Tax),
- On Excise Duty.

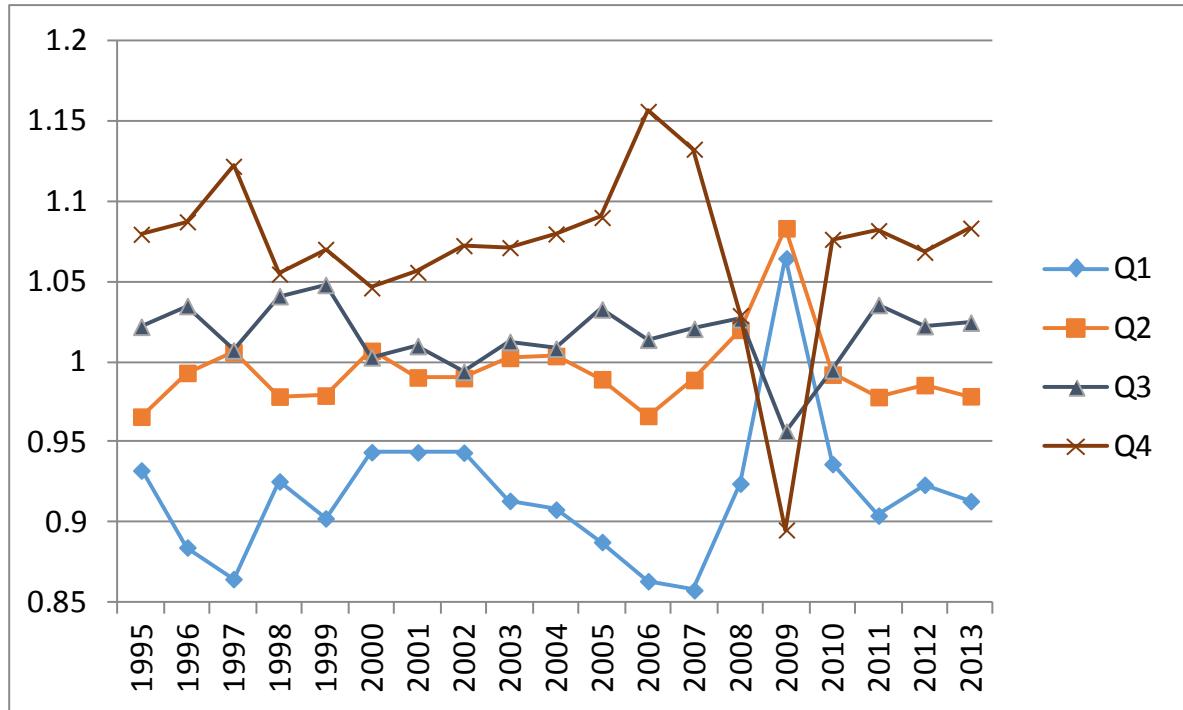

# Seasonality Analysis

- Revenues of Direct Taxes, m EUR

  - Annual

# Monthly Data

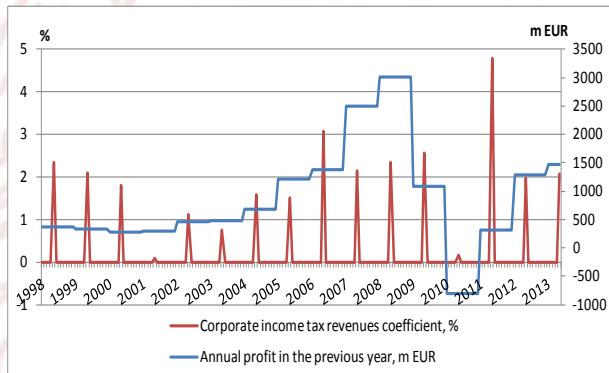

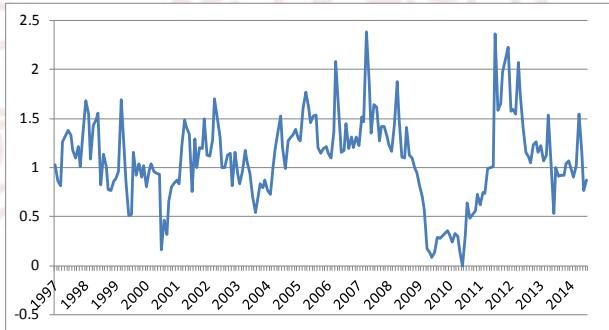

- Seasonality Indexes
- Corporate Income Tax Revenues

# Corporate Income Tax Revenues

- CIT revenues =  $\text{coef}_{\text{monthly}} * \text{CIT revenues}_{\text{lag}} * (1 + \text{PCI}_{\text{infl}}/100)/12 + \text{coef}_{\text{may}} * \text{PROF}_{\text{lag}}/100$

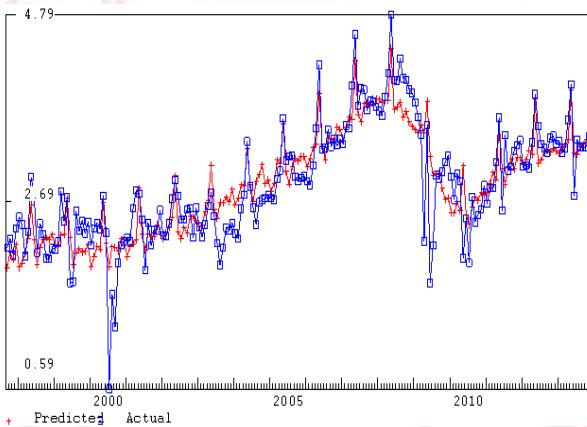

where CIT revenues – corporate income tax revenues,  
CIT revenues<sub>lag</sub> – annual corporate income tax revenues with 17-month lag,  
 $\text{coef}_{\text{monthly}}$  – corporate income tax advance payments coefficient,  
 $\text{PCI}_{\text{infl}}$  – annual growth rate of private consumption price index in the previous year,  
 $\text{coef}_{\text{may}}$  – corporate income tax revenues coefficient applied only in May,  
 $\text{PROF}_{\text{lag}}$  – annual profit in the previous year.

2014.001 – 2014.007

- MAPE = 14.3%
- Modified dummy MAPE = 3.6%

# MAPE Values, % (Quarterly Data)

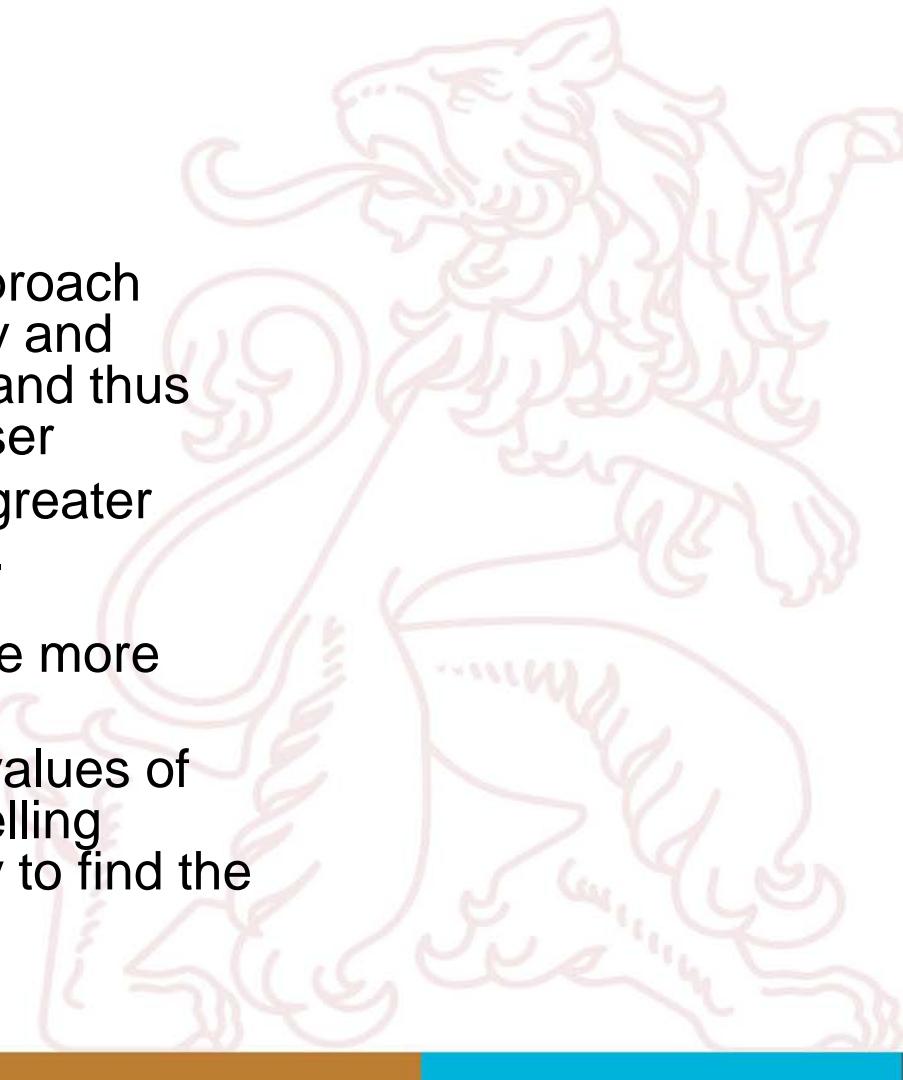

Tax Type	2014 I	2014 I and II
Social Contributions	3.7	2.2
Personal Income Tax	6.8	-
Corporate Income Tax	0.4	2.5
Value Added Tax	15.4	16.5
Excise Duty	0.7	2.0

# Comparison of Forecasts

Tax Type	Identity-based approach			Econometric equations	
	Monthly	Quarterly	Annual	Monthly	Quarterly
Social Contributions	-	2271.3	2139.6	-	2237.2
Personal Income Tax	-	1379.3	1415.1	-	1385.0
Corporate Income Tax	342.3	359.2	350.0	359.5	354.6
Value Added Tax	-	1885.1	1738.7	-	1638.5
Excise Duty	-	757.1	731.2	-	777.9

# Conclusions

- Using annual data, identity-based approach should be preferred, however quarterly and monthly data can give similar results and thus the choice is in hands of the model-user
- Identity-based approach allows for a greater flexibility in scenario-building process. Econometric approach involves less assumptions and thus may seem to be more objective
- Forecasts depend very much on the values of exogenous indicators, therefore modelling approaches should be tested regularly to find the most reliable ones
